

Spring MVC App Setup

Project Structure:

Step 1:

- Create Dynamic Web App and Convert it into Maven Project
- Add Following dependencies in POM.xml file
 - o Spring core
 - o Spring beans
 - o Spring context
 - o Spring web
 - o Spring webmvc
- Create AppInitializer file and convert it to DispatcherServlet.

```
public class AppInitializer extends AbstractAnnotationConfigDispatcherServletInitializer{  
  
    @Override  
    protected Class<?>[] getRootConfigClasses() {  
  
        return null;  
    }  
  
    @Override  
    protected Class<?>[] getServletConfigClasses() {  
        Class<?>[] classes = new Class[]{ServletConfig.class};  
        return classes;  
    }  
  
    @Override  
    protected String[] getServletMappings() {  
        String[] mappings = new String[] {"/"};  
        return mappings;  
    }  
}
```

- Create a ServletConfig file and add annotations

```
@Configuration
@EnableWebMvc
@ComponentScan(basePackages = {"com.spring.app.main.controller"})
public class ServletConfig implements WebMvcConfigurer{
```

- Create a Controller Class and add Request Mappings to it.

```
@Controller
public class MyController {

    @RequestMapping("/")
    public String showDashboard() {
        return "WEB-INF/jsp/dashboard.jsp";
    }

    @RequestMapping("/employees")
    public String showEmployees() {
        return "WEB-INF/jsp/employees.jsp";
    }
}
```

- Create jsps in WEB-INF/jsp/ folder in Web Content

```
<div>
    <a href="${pageContext.request.contextPath}/employees">Employees</a> <br />
    <a href="${pageContext.request.contextPath}/colleges">Colleges</a> <br />
    <a href="${pageContext.request.contextPath}/students">Students</a> <br />
</div>
```
